SUMMARY

• INTRODUCTION
the problem of landfill gas (LFG) emission in Municipal Solid Waste Landfills

• THE FLUX-METER (the accumulation chamber)
  ✓ An integrated instrument
  ✓ Advantages

• DATA PROCESSING
a tool to estimate the total amount of LFG discharged into the atmosphere

• CONCLUSION
• **Municipal Solid Waste Landfills (MSW):** important sources of atmospheric contamination due to diffusive emissions of landfill gas (LFG) from the cover.

• **Composition of LFG**
  - CH$_4$ and CO$_2$ (greenhouse gases)
  - Compounds present in trace with toxic and malodorous characteristics.

• **Legislation:** D.Lgs. 152/2006 and EU Directive 96/61/CE

→ **EVALUATION OF LANDFILL EMISSIONS**

**INTRODUCTION**

- **Municipal Solid Waste Landfills (MSW):** Important sources of atmospheric contamination due to diffusive emissions of landfill gas (LFG) from the cover.

- **Composition of LFG**
  - $\text{CH}_4$ and $\text{CO}_2$ (greenhouse gases)
  - Compounds present in trace with toxic and malodorous characteristics.

- **Legislation:** D.Lgs. 152/2006 and EU Directive 96/61/CE

→ **Evaluation of Landfill Emissions**
The numerous techniques to **quantify the flux released** from soil (landfill) can be divided in three main categories:

- Measurements of the gas concentration gradient
- Micro-meteorological techniques (e.g. eddy correlation)
- Enclosure based techniques (static and dynamic accumulation)

⇒ **The Accumulation Chamber**
The Flux-Meter

Flux-Meter: Integrated instrument, based on accumulation chamber, for the measurement of the diffuse degassing phenomena

Why a static non-stationary technique?

- It is the least affected by environmental and meteorological parameters (Trégourés et al., 1999)
- It allows soil gas flux measurements without any information about soils characteristics and flux conditions or ranges
- These methods are much faster in respect to other techniques
The Flux-Meter

Flux-Meter: Integrated instrument, based on accumulation chamber, for the measurement of the diffuse degassing phenomena

Why a static non-stationary technique?

• It is the least affected by environmental and meteorological parameters (Trègourès et al., 1999)
• It allows soil gas flux measurements without any information about soils characteristics and flux conditions or ranges
• These methods are much faster in respect to other techniques

The integrated instrument realized by West Systems:

- Accumulation chamber
- Palmtop computer (PDA) with integrated GPS
- A backpack with:
  - gas analyzers
  - Electronics
  - battery

THE FLUX-METER

Main characteristics:

• PDA: to receive and exchange information with the instrument via a Bluetooth wireless connection

• Specific software to acquire:
  ✓ gas species (CO2, CH4, H2S, VOC)
  ✓ GPS data → automatic geo-referencing of the flux measure
  ✓ other data (P and T of the measuring cells of the detectors and battery voltage of the system)

• The concentration data are represented in function of time, and the flux curves are visualized in real time to be checked and validated by the operator

• All the data acquired are saved into the PDA memory and on the on-board Micro-SD card to be available for further processing
The FLUX-METER

Main characteristics:

Field measurement:

- The chamber edge must be well attached to the ground to avoid the input of atmospheric air
- A fan ensures the mixing of the gases
- The gas is continuously extracted from the chamber, sent to the analysers, and then injected again inside the chamber
- The operator can visualize on the PDA the increase of gas concentration vs. time and the software computes the flux in real-time

THE FLUX-METER

MAIN ADVANTAGES:

• **Integration of high performance detectors:** able to measure very low CH₄, CO₂, H₂S and VOC concentrations

• **Portable instrumentation:** total weight, including accumulation chamber, is less than 10 Kg

• **manageability of the device**

• **simple use**

• **Fast flux measurements:** 2-3 minutes per measurement
Main advantages:

• Integration of high performance detectors: able to measure very low CH4, CO2, H2S and VOC concentrations

DATA PROCESSING

An example

- **AIM**: Quantify the total flux released from a MSW of about 140,000 square meter

- **FIELD ACTIVITY**: Flux measures in specific points inside the whole investigated area located in a regular grid (mesh size of 20x20 meters)

- **METHODOLOGY**: statistical and geostatistical approach to quantify a specific gas released from the investigated area and to recognize the presence of zones characterized by anomalous fluxes

DATA PROCESSING

STATISTICAL ANALYSIS

Methodology based on partitioning the flux data by means of cumulative probability plots, formalized by Sinclair (Sinclair, 1970 and 1991).

It allows to recognize different populations from the whole of the data.

An implementation for pc of the Sichel method has been developed by West Systems. It allows to calculate:

• the cumulative probability plot
• the total output of LFG knowing the extension of the investigated area (Raco et al., 2010).

**CONCLUSION**

**FLUX-METER**, an integrated equipment

- allows the measurements of the real amount of CO$_2$, CH$_4$, H$_2$S, and VOC discharged into the atmosphere
- permits to carry out **quick** and **reliable punctual measurements**

All registered data by Flux-Meter can be processed:

- by an implementation of the Sichel method
  
  ➔ quantify the total amount of LFG
  ➔ estimation of LFG lost by the capture system
- by geostatistical method (elaboration of isoflux maps)
  ➔ visualization of high fluxes zone
